

Inside Food Contact Materials

WHAT YOU NEED TO KNOW

Plastic Food Contact Materials play a crucial role in preserving food from contaminants and preventing food waste. Yet, some worry about the chemicals that are required in the production of these important materials.

What are Food Contact Materials?

"Food Contact Materials", or FCMs for short, refers to all *materials* that come into contact with food.

Natural migration occurs whenever two materials come into contact with each other

Migration is a natural and unavoidable phenomenon that occurs **in all materials**. Whenever two materials come into contact with each other, substances can migrate from one material into another. This also happens with food packaging and food.

Risk assessments make sure that Food Contact Materials are safe

A risk assessment is based on different elements to assess potential health risks associated with exposure to substance migration into the food.

HAZARD IDENTIFICATION:

Identifies potential health effects in humans and/or environment, caused by chemicals.

EXPOSURE ASSESSMENT:

Evaluates the potential chemical exposures to humans and the environment from the production, distribution, use, disposal and recycle of a chemical substance.

RISK CHARACTERIZATION:

Integrates those identification and assessment results to determine the probability of occurrence of health and/or environmental effects in a given population.

Quantity is key

Even natural substances can interact with the body but would only cause adverse effects from a certain dose. It is the **quantity** which **sets the risk**.

Water:

Water is vital for leading a healthy lifestyle. We need water to remain hydrated and energised.

Water intoxication can occur when a person drinks so much that the water dilutes the concentration of sodium in the blood, creating an electrolyte imbalance. Water intoxication, known as hyponatremia, is mostly a risk for endurance athletes.

Adequate Daily Intake:
around 2.5 litres¹

Coffee:

Coffee has antioxidants and nutrients that contribute to good health. Coffee increases your focus and can improve energy levels.

Too much caffeine can cause insomnia, restlessness, nausea, irregular heartbeat, muscle tremors, anxiety and headaches.

ADI: 400 milligrams²

Soy sauce:

Soy sauce has some great health benefits: it is low in calories and very high in natural antioxidants.

If consumed in too large a portion, it increases blood sodium levels, potentially leading to neurological problems.

ADI: 2 tablespoons (32 grams)³

THE RESULT ENSURES SAFE USE OF PRODUCTS

EFSA

The European Food Safety Authority performs a risk assessment of the substance to ensure a high level of human health protection. The safety limit is based on the toxicological profile of each substance.

Why is packaging so important?

Food waste is a huge problem, in Europe and beyond...

16%⁴ — the amount of food that the average EU consumer wastes

According to the WHO, in the less developed world up to **50%** of all food is wasted between harvest and home⁴.

... and food poisoning is a massive problem as well...

351.000⁵ people have globally **died** per year as a result of food poisoning.

In the UK, more than **1 million people** per year have been poisoned by deteriorated food, leading to **500 deaths⁶**.

... But adequate food packaging could change this!

Packaging plays an important role in ensuring the freshness of food, extends its shelf life and helps to improve the quality of products for consumers.

In a **sustainable society**, using modern packaging and storage systems, wastage is reduced dramatically to around

3%⁴

Inside Food Contact Materials

**HOW CAN WE
BE SURE THAT THEY
ARE SAFE?**

**A SCIENCE-BASED ANALYSIS
IS PERFORMED TO ENSURE
THE SAFE USE OF AN
ADDED SUBSTANCE**

EFSA

Technical dossier

The technical dossier is part of a scientific and regulatory process which determines the safe use of an added substance

1

Identity and physico-chemical properties of the substances

The goal is to understand the substance and how it migrates. The applicant provides information on the basic properties (e.g. solubility and stability) and explains the final use of the substance, including: maximum use level, function, in which plastic(s), in contact with which foods, what are the contact conditions (time, temperature...), etc.

2

Data on the residual content of the substance in the Food Contact Material

The objective is to understand how much of the substance is present and what type of specific migration can be expected.

Residual content is the actual content in the final material placed on the market.

3

Migration data of the substance

The purpose is to comprehend how much of a substance is migrating into food. This is done by testing different types of food and real storage conditions (time/temperature).

4

Toxicological data and microbiological properties of the substance

The applicant needs to demonstrate that, in case of microbiological properties of a substance, these have no effect on the food. To demonstrate that levels of migration into food are safe for human consumption, the applicant provides the adequate toxicological reports.

5

Evaluation of existing assessments

The applicant provides information on whether a substance is already approved in a consumer application elsewhere.

Conclusions

EFSA reports its conclusions to the European Commission. If approved, the substance can be used in FCMs. The substance is safe and suitable to be used in food contact according to the descriptions included in the technical dossier.
